Stock Intelligence — friends version: setup guide

When you finish, you and your friends will each have a login. On every phone and laptop you'll see:

- the **same official analysis** of each stock, published every weekday at about 8 pm from NSE's previous-day closing data
- your **own** XP, predictions and watchlist
- a **shared leaderboard** ranked by calibration, so well-judged confidence beats lucky guesses

Cost: ₹0 (GitHub and Supabase free plans). **Time:** about 45 minutes, once.

> **Phone tip:** if you can't find a button named here, open your browser menu and turn on **Desktop site**.

The pieces

Piece	What it does
GitHub	Stores the app, hosts the website, and runs the 8 pm job
Supabase	Free online database: logins, predictions, leaderboard, quarterly results
NSE files	Free previous-day prices, volume and delivery %

The files

File	What it is
`index.html`	The app
`config.js`	Your Supabase address and public key (you fill in two lines)
`engines.js`, `live.js`, `data.js`	The MBF2.0, TAF1.0 and PVST engines and AHCL's financials (shared by the app and the 8 pm job)

`fetch_data.py`	Downloads NSE data
`nightly.js`	Runs the official analysis and scores predictions
`watchlist.txt`	Stocks to download
`setup.sql`	Creates the database (pasted once into Supabase)
`update-data.yml`	The 8 pm timer
`README.md`	This guide

Part 1 — GitHub

Already did the first guide? Skip to **Step 1.4**.

1.1 Create an account

Go to **github.com → Sign up**. Choose a simple username: it becomes part of your app's address.

1.2 Create a repository

+ → New repository. Name it `stock-intelligence`, choose **Public**, tick **Add a README file**, then **Create repository**.

1.3 Allow the timer to save data

Settings → Actions → General → Workflow permissions → Read and write permissions → Save.

1.4 Upload the files

1. Save all files from Claude to your phone.
2. In your repository: **Add file → Upload files**.
3. Select every file **except** `update-data.yml` and `setup.sql`. Files with the same name are replaced automatically.
4. Tap **Commit changes**.

1.5 Add or update the timer file

- **New setup: Add file → Create new file**, type the name `.github/workflows/update-`

`data.yml`, paste the contents of `update-data.yml`, and commit.

- **Already have it:** open `.github` → `workflows` → `update-data.yml`, tap the **pencil** ✏️, select all, paste the new contents, and commit.

1.6 Turn on the website

Settings → Pages → Deploy from a branch → main → /(root) → Save. After 1–2 minutes the page shows your address, for example `https://yourname.github.io/stock-intelligence/`. **Copy it**: you need it in Step 2.3.

Part 2 — Supabase (the shared database)

2.1 Create a project

1. Go to **supabase.com → Start your project**. **Continue with GitHub** is the easiest sign-in.
2. Tap **New project**. Name it `stock-intelligence`.
3. **Database password:** tap Generate and save it somewhere safe. You won't need it for daily use.
4. **Region:** choose **Mumbai** (or the nearest one offered).
5. Tap **Create new project** and wait about 2 minutes.

2.2 Create the database

1. In the left menu open **SQL Editor**, then **New query**.
2. Open `setup.sql` from Claude, copy **all** of it, and paste it into the editor.
3. Tap **Run**. You should see **"Success. No rows returned."**

2.3 Login settings

1. **Authentication → Sign In / Providers → Email**: switch **off** "Confirm email", then **Save**. Friends can then sign in straight away without a confirmation email.
2. **Authentication → URL Configuration → Site URL**: paste your app address from Step 1.6, then **Save**. This makes "Forgot password" emails open your app.

2.4 Copy your keys

Open **Project Settings → API Keys** (or tap the **Connect** button at the top). You need three values:

Value	Looks like	Goes into
Project URL	`https://abcdxyz.supabase.co`	`config.js` **and** GitHub secret `SUPABASE_URL`
Publishable key (or legacy **anon** key)	`sb_publishable_…` or `eyJ…`	`config.js` only
Secret key (or legacy **service_role** key)	`sb_secret_…` or `eyJ…`	GitHub secret `SUPABASE_SERVICE_KEY` only

> ⚠️ The **secret** key can read and change everything. Never put it in `config.js` and never share it.

Part 3 — Connect the two

3.1 Fill in config.js

In GitHub, open `config.js` and tap the **pencil** ✏️. Replace the two placeholder lines with your Project URL and **publishable** key, keeping the quote marks:

```
supabaseUrl: 'https://abcdxyz.supabase.co',
supabaseAnonKey: 'sb_publishable_xxxxxxxx'
```

Then tap **Commit changes**.

3.2 Add the two GitHub secrets

In your repository: **Settings → Secrets and variables → Actions → New repository secret**.

1. Name `SUPABASE_URL`, value = your Project URL → **Add secret**.
2. Name `SUPABASE_SERVICE_KEY`, value = your **secret** key → **Add secret**.

3.3 Run the evening job once

Actions → Update market data → Run workflow. Wait for the green ✓. The first run takes 5–10 minutes.
Tap the run → **update** → open **Publish the official analysis**. You should see a line like:
`AHCL 2026-10-07: MBF … · TAF … · PVST … (published)`

3.4 Create YOUR account first

Open your app address and tap **"I was invited — create account"**. Enter your name, email and a password.
The first account ever created becomes the admin. Do this before you share the link with anyone.

3.5 Invite friends

1. In the app: **Settings → Admin · friends**. Add each friend's email.
2. Send them the app link and ask them to tap **"I was invited — create account"** using that exact email.

Anyone not on your list sees *"This email has not been invited yet."*

Everyday use

Nothing to do daily. The data refreshes, the official analysis publishes, and 30-session calls are scored automatically every weekday evening.

After a company reports results (quarterly). Go to **Settings → Admin · quarterly results**. Enter the quarter (e.g. `Q2FY27`), the result date, and consolidated revenue, EBITDA and net profit in ₹ crore, then tap Save. Everyone's view updates immediately; the official analysis includes it from that evening. **Enter results before 8 pm** so the official analysis and everyone's screens use the same numbers.

How the challenge works for friends:

1. Each stock and data date allows **one** prediction per person, timestamped by the server.
2. Opening the analysis first closes that date's challenge for that person, on every device.
3. The server scores each answer against the official analysis, using the same Brier rule as before.
4. The leaderboard sorts by average Brier score (lower is better), then XP.

If something goes wrong

What you see	What to do
App shows no login	`config.js` still has the placeholder text, or the URL/key has a

screen	typo. Redo Step 3.1.
"This email has not been invited yet"	Admin adds the email in Settings → Admin · friends. The email must match exactly.
"Wrong email or password"	Check the details, or use **Forgot password**.
"This email is not confirmed"	Redo Step 2.3 (switch off Confirm email).
"Official analysis isn't published yet"	Evening job hasn't run or failed. Check **Actions**.
Red ✕ on **Publish the official analysis**	Secrets are wrong or missing. Redo Step 3.2, then re-run the job.
Red ✕ on **Download NSE data**	Copy the last 20 lines of that step and send them to Claude.
Supabase email saying the project is **paused**	Open the Supabase dashboard and tap **Restore**. Free projects can pause when inactive; the weekday job normally keeps it active.

Privacy and data

- **Stored in Supabase:** each person's name, email, predictions, XP, watchlist and settings. Passwords are handled by Supabase and never visible to you.
- **Who sees what:** friends see only their own predictions plus the leaderboard (names, call counts, accuracy, Brier, XP). Only the admin sees the invite list and the official answer key.
- **Data:** previous-day NSE data, used for education and validation. A paid product needs NSE's written consent for end-of-day data.
